## e. Backlight Driving Conditions

Parameter	Symbol	Min.	Тур.	Max.	Unit	Remark
LED Lightbar current	Ι <sub>L</sub>	-	150	-	mA	Note 1, 2
Power consumption	Р		1.58	1.68	W	
LED Lightbar life time		10,000	-	-	Hr	Note 1, 2, 3, 4

Note 1: LED backlight is LED lightbar type(18 pcs of LED).

Note 2: Definition of "LED Lifetime": brightness is decreased to 50% of the initial value. LED Lifetime is restricted under normal condition, ambient temperature = 25°C and LED lightbar current= 150mA

Note 3: The value is only for reference.

Note 4: If it operates with LED lightbar voltage more than 150mA, it maybe decreases LED lifetime.

Note 1: If input timing operates with Min. to Typ. setting, the PWCK value use default value 1973 (Register R39=0000\_0111, Register R40=1011\_0101), and no need to change SPI register.

Note 2: If input timing operates with Typ. to Max. setting, the PWCK value must be set to 2025(Register R39=0000\_0111, Register R40=1110\_1001). Please reference the Serial interface setting table in Page.16 to set SPI Register R39 and R40 value.

#### b. Register Bank

A totally 16-bit register includeing 7-bit address D[15:9], 1-bit Read bit D[8], and 8-bit data D[7:0] can be set via 3-wire serial peripheral interface. Beflow figure is for a detail description of the parameters.

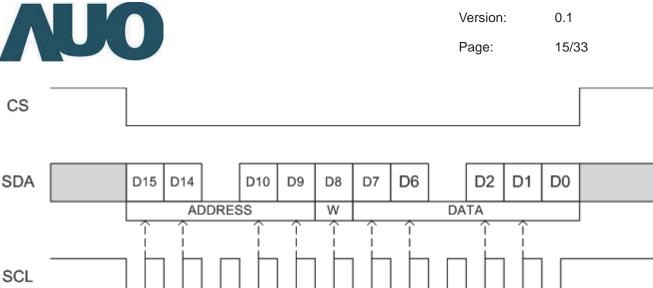

Figure. Serial interface read sequence

- (1) Each serial command consists of 16bits of data which is loaded one bit a time at the rising edge of serial slock SCL.
- (2) Command loading operation starts from the falling edge of CS and is completed at the next rising edge of CS.
- (3) The serial control block is operational after power on reset, but commands are established by the following rising edge of End Frame. If command is transferred multiple times for the same resgister, the last command before the following rising edge of the End Frame is valid, except for some special registers (ex. GRB, etc.).
- (3) If less the 16 bits of SCL are input while CS is low, the transferred data is ignored. The read operation interrupt.
- (4) If 16 bits or more of SCL are input while CS is low, the first 16 bits of transferred data in the duration of CS="L" are valid data.
- (5) Serial block operates with the SCL clock
- (6) Serial data can be accepted in the standy(power save) mode.
- (7) It is suggested that DE, DCLK always exists in the same time.
- (8) When GRB is activated through the serial interface, all register are cleared, except the GRB value.
- (9) The register setting values are rewritten by the influence of static electricity, a noise, etc. to unsuitable value, incorrect operating may occur. It is suggested that the SPI interface will setup as frequently as possible.

# Note 3: Definition of response time:

The output signals of photo detector are measured when the input signals are changed from "black" to "white" (falling time) and from "white" to "black" (rising time), respectively.

The response time is defined as the time interval between the 10% and 90% of amplitudes. Refer to figure as below.

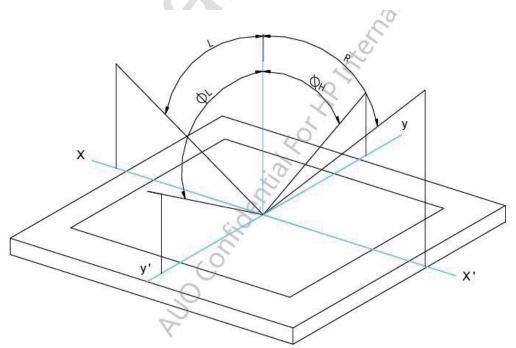

Note 4. Definition of contrast ratio:

Contrast ratio is calculated with the following formula.

Photo detector output when LCD is at "White" status Contrast ratio (CR) = Photo detector output when LCD is at "Black" status

Note 5. Definition of viewing angle,  $\theta$ , Refer to figure as below.

Note 6. Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.

Note 7: Luminance Uniformity of these 9 points is defined as below:

minimum luminance in 9 points (1-9) Uniformity = maximum luminance in 9 points (1-9)

Others	Gun to Panel Distance     No SPI command, keep default register settings.	

Note 5: Operate with 5x5 chess board pattern as figure and lasting time and temperature as the conditions. Then judge with 50% gray level after waiting 20 min, the mura is less than JND 2.5.

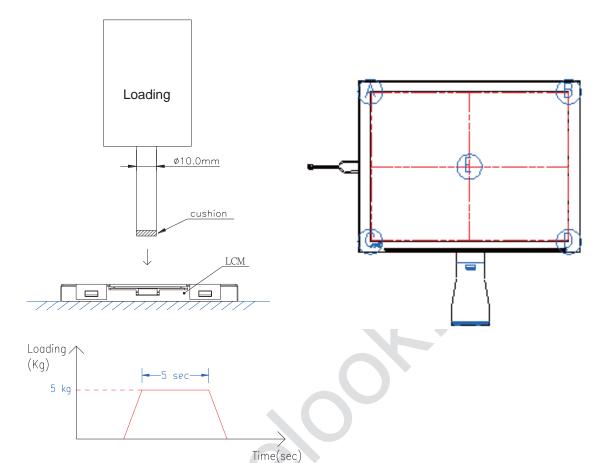

Note 6: The panel is tested as figure. The jig is \$\psi\$ 10 mm made by Cu with rubber and the loading speed is 3mm/min on position A~E. After the condition, no glass crack will be found and panel function check is OK.( no guarantee LC mura . LC bubble)

Note 7. In Reliability test, performance is confirmed after leave in room temperature

#### 2. Module/Panel Label Information

The module/panel (collectively called as the "Product") will be attached with a label of Shipping Number which represents the identification of the Product at a specific location. Refer to the Product outline drawing for detailed location and size of the label. The label is composed of a 22-digit serial number and printed with code 39/128 with the following definition:

## <u>ABÇDEFGHIJKLMNOPQRSTUV</u>

For internal system usage and production serial numbers.

AUO Module or Panel factory code, represents the final production factory to complete the Product

Product version code, ranging from 0~9 or A~Z (for Version after 9)

Week Code, the production week when the product is finished at its production process

#### 3. Carton Label Information

The packing carton will be attached with a carton label where packing Q'ty, AUO Model Name, AUO Part Number, Customer Part Number (Optional) and a series of Carton Number in 13 or 14 digits are printed. The Carton Number is apparing in the following format:

#### ABC-DEFG-HIJK-LMN

DEFG appear after first "-" represents the packing date of the carton
Date from 01 to 31
Month, ranging from 1~9, A~C. A for Oct, B for Nov and C for Dec.
A.D. year, ranging from 1~9 and 0. The single digit code reprents the last number of the year

Refer to the drawing of packing format for the location and size of the carton label.

#### H. Precautions

- 1. Do not twist or bend the module and prevent the unsuitable external force for display module during assembly.
- 2. Adopt measures for good heat radiation. Be sure to use the module with in the specified temperature.
- 3. Avoid dust or oil mist during assembly.
- 4. Follow the correct power sequence while operating. Do not apply the invalid signal, otherwise, it will cause improper shut down and damage the module.
- 5. Less EMI: it will be more safety and less noise.
- 6. Please operate module in suitable temperature. The response time & brightness will drift by different temperature.
- 7. Avoid to display the fixed pattern (exclude the white pattern) in a long period, otherwise, it will cause image sticking.
- 8. Be sure to turn off the power when connecting or disconnecting the circuit.
- 9. Polarizer scratches easily, please handle it carefully.
- 10. Display surface never likes dirt or stains.
- 11. A dewdrop may lead to destruction. Please wipe off any moisture before using module.
- 12. Sudden temperature changes cause condensation, and it will cause polarizer damaged.
- 13. High temperature and humidity may degrade performance. Please do not expose the module to the direct sunlight and so on.
- 14. Acetic acid or chlorine compounds are not friends with TFT display module.
- 15. Static electricity will damage the module, please do not touch the module without any grounded device.
- 16. Do not disassemble and reassemble the module by self.
- 17. Be careful do not touch the rear side directly.
- 18. No strong vibration or shock. It will cause module broken.
- 19. Storage the modules in suitable environment with regular packing.
- 20. Be careful of injury from a broken display module.
- 21. Please avoid the pressure adding to the surface (front or rear side) of modules, because it will cause the display non-uniformity or other function issue.
